

## Welcome to CS61A!

- This is a course about [programming](#), which is the art and science of constructing artifacts ("programs") that perform computations or interact with the physical world.
- To do this, we have to learn a [programming language](#) (Python in our case), but programming means a great deal more, including
  - [Design](#) of what programs do.
  - [Analysis](#) of the performance of programs.
  - [Confirmation](#) of their correct operation.
  - [Management](#) of their [complexity](#).
- This course is about the "big ideas" of programming. We expect most of what you learn to apply to any programming language.

CS61A: Lecture #1 1

## Programming and Computer Science

- Programming is the main tool of [computer science](#):  
*The study of computation and its applications.*
- It is one of the *Sciences of the Artificial* (H. Simon).
- There are many applications and subareas, including:
  - Systems
  - Artificial Intelligence  
*Games, robotics, natural language processing...*
  - Graphics
  - Security
  - Networking
  - Programming Languages
  - Theory
  - Scientific Computation

CS61A: Lecture #1 2

## This week

- Please see the course web site, especially the course information link. (Please bear with us: the web site is under construction).
- This week, there was no lab. Discussion section will meet as usual.
- You'll get account forms next week in lab.
- Discussion sections are full: please try to find a non-full section, even if it conflicts.
- Attend any lab or section where there is some room. Those enrolled in a lab get priority, but you can get around this by bringing a laptop.

CS61A: Lecture #1 3

## Course Organization

- [Readings](#) cover the material. Try to do them before...
- [Lectures](#) summarize material, or present alternative "takes" on it.
- [Laboratory exercises](#) are "finger exercises" designed to introduce a new topic or certain practical skills. Unlimited collaboration.
- [Homework assignments](#) are more involved than lab exercises and often *require some thought*. Plan is to have them due on Monday. Feel free to discuss the homework with other students, but turn in your own solutions.
- [Projects](#) are four larger multi-week assignments intended to teach you how to combine ideas from the course in interesting ways. We'll be doing at least some of these in pairs.
- Use the discussion board (Piazza) for news, advice, etc.

CS61A: Lecture #1 4

## Alternatives to this Course

- If you have very little exposure to programming...
- Or, after the first few sessions, feel that you really aren't ready,
- You can consider other courses to get into the subject more gradually:
  - [CS 61AS: "Self-paced" CS61A](#). Uses Scheme rather than Python.
  - [CS 10: The Beauty and Joy of Computing](#) (course for non-majors).
- If you decide to do so, please be sure to officially drop the course, so that we can clear the waiting list.

CS61A: Lecture #1 5

## Getting Help

- We don't expect you to go it alone!
- The staff is here to help. Feel free to make free use of lab assistants, TAs, and me by email or in person during office hours.
- And don't forget our message/discussion board: Piazza. This is where students help each other (there are lots of you, and someone probably knows the answer to your question).
- We *very strongly* suggest that you form or join a study group.

CS61A: Lecture #1 6

## Mandatory Warning

- We allow unlimited collaboration on labs.
- On homework, again feel free to collaborate, but you'll get the most out of it if you try to work out answers for yourself first.
- On projects, feel free to talk to others (e.g., via Piazza), but we expect that you and your partner (if any) submit original work.
- Don't share your code with others (other partnerships).
- You can take small snippets of code within reason (ask if unsure), but you *must* attribute it!
- Otherwise, copying is against the Code of Conduct, and generally results in penalties.
- We can search the web for solutions, too. We have computers and we know how to use them.
- Most out-and-out copying is due to desperation and time pressure. Instead, see us if you're having trouble; that's what we're here for!

CS61A: Lecture #1 7

## What's In A Programming Language?

- **Values:** the things programs fiddle with;
- **Primitive operations** (on values);
- **Combining mechanisms:** glue operations together;
- **Predefined names** (the "library");
- **Definitional mechanisms:** which allow one to introduce symbolic names and (in effect) to extend the library.

CS61A: Lecture #1 8

## Python Values (I)

- Python has a rich set of values, including:

Type	Values	Literals (Denotations)
Integers	0 -1 16 13 36893488147419103232	0 -1 0o20 0b1101 0x200000000000000000
Boolean (truth) values "Null"	true, false	True False None
Functions		operator.add, operator.mul, operator.lt, operator.eq

- Functions take values and return values (including functions). Thus, the definition of "value" is **recursive**: definition of function refers to functions.
- They don't look like much, perhaps, but with these values we can represent anything!

Last modified: Thu Jan 23 03:58:06 2014

CS61A: Lecture #1 9

## Python Values (II)

- ...but not conveniently. So now we add more complex types:

Type	Values	Literals (Denotations)
Strings	pear, I ♥ NY Say "Hello"	"pear" "I \u2661 NY" "Say \"Hello\""
Tuples		(), (1, "Hello", (3, 5))
Ranges	0-10, 1-5	range(10), range(1, 5)
Lists		[], [1, "Hello", (3, 5)] [ x**3 for x in range(5) ]
Dictionaries		{ "Paul" : 60, "Ann" : 59, "John" : 56 }
Sets	{}, {1, 2}, {x   0 ≤ x < 20 ∧ x is prime}	set([ ]), { 1, 2 }, { x for x in range(20) if prime(x) }
and many others

CS61A: Lecture #1 10

## What Values Can Represent

- The tuple type (as well as the list, dictionary, set class types) give Python the power to *represent* just about anything.
- In fact, we could get away with allowing just *pairs*: tuples with two elements:
  - Tuples can contain tuples (and lists can contain lists), which allows us to get as fancy as we want.
  - Instead of (1, 2, 7), could use (1, (2, (7, None))),
  - But while elegant, this would make programming tedious.

CS61A: Lecture #1 11

## Python's Primitive Operations

- Literals are the *base cases*.
- Functions in particular are the starting point for creating programs:  
sub(truediv(mul(add(add(3, 7), 10), sub(1000, 8)), 992), 17)
- To evaluate a function call:
  - Evaluate the callee (left of the parentheses), a function.
  - Evaluate the arguments (within the parentheses).
  - The callee then tells what to do and what value to produce from the operands' values,
- For the convenience of the reader, though, Python employs a great deal of "**syntactic sugar**" to produce familiar notation:  
(3 + 7 + 10) \* (1000 - 8) / 992 - 17

CS61A: Lecture #1 12

## Combining and Defining

- Certain primitives are needed to allow **conditional execution**:

```
print(1 if x > 0 else -1 if x < 0 else 0)
# or equivalently
if x > 0:
    print(1)
elif x < 0:
    print(-1)
else:
    print(0)
```

- Defining a new function:

```
def signum(x):
    return 1 if x > 0 else -1 if x < 0 else 0
```

Now `signum` denotes a function.

- Doesn't look like we have a lot, but in fact we already have enough to implement *all the computable functions on the integers*!

CS61A: Lecture #1 13

## Getting repetition

- Haven't explicitly mentioned any construct to "repeat  $X$  until ..." or "repeat  $X$   $N$  times." Technically, none is needed.

- Suppose you'd like to compute  $x + 2x^2 + 3x^3 + \dots + Nx^N$  for any  $N$ :

```
def series(x, N):
    if N == 1:
        return x
    else:
        return N * x**N + series(x, N-1)
```

- But again, we have syntactic sugar (which is the usual approach in Python):

```
def series(x, N):
    S = 0
    for k in range(1, N+1):
        S += k * x**k
    return S
```

CS61A: Lecture #1 14

## A Few General Rules

- Whatever the assignment, start now.
- "Yes, that's really all there is. Don't fight the problem."
- Practice is important. Don't just assume you can do it; do it!
- *ALWAYS* feel free to ask us for help.
- BCDDBC (Be Curious; Don't Be Clueless)
- RTFM
- Have fun!
