#### Lecture #8: More Recursion

#### Announcements:

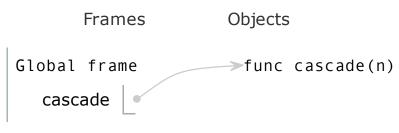

- Project #1 due next Thursday (13 Feb).
- Test #1 Tuesday, 18 Feb at 8PM.
- AWE 61A Party this Sunday (9 Feb) in the Woz, 1-3PM.
- Guerilla Sections this weekend (see Piazza).
- Self-assessment quiz will be released tonight, due Monday. Watch the website and Piazza

# A Simple Recursion

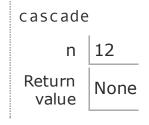

```
def cascade(n):
       if n < 10:
           print(n)
       else:
           print(n)
6
           cascade(n//10)
           print(n)
  cascade (123)
```

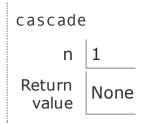

#### Program output:

riogia	iiii outpu	ı.		
123 12 1 12				
12				

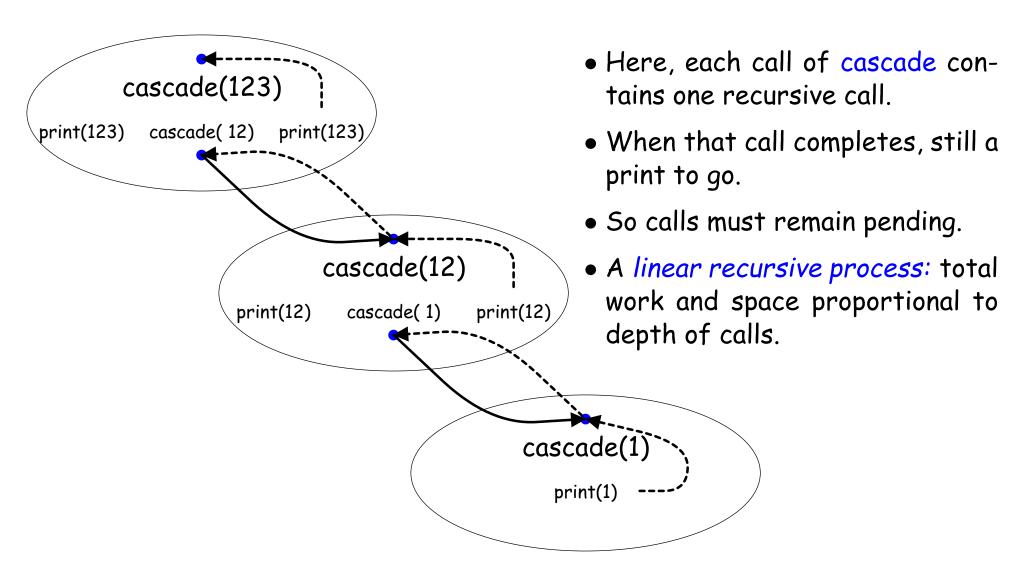

cascade n 123

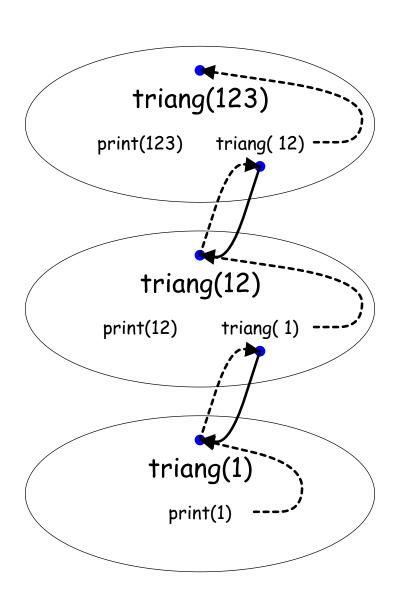

- Each frame connects to the global frame.
- Frames without "Return value" are still active
- Fach recursive call has its own *n* value.
- That's how it works, but try not to think of it this way!
- Think recursively instead.

# Classifying Recursions: Linear Recursions

# Classifying Recursions: Iterative Processes

```
def triang(n):
    print(n)
    if n < 10: triang(n-1)</pre>
```

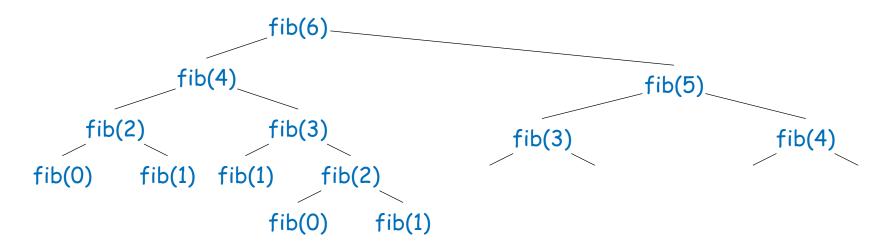

- Again, each call of triang contains one recursive call.
- So this is a type of linear recursive process.
- But there's no more to do when that call completes (tail recursive)
- So in principle, calls need not remain pending.
- An iterative process: total work still proportional to depth of calls, but total space need not be.
- This kind is suitable for a loop.

# Classifying Recursion: Tree Recursions

 Previously, we looked at a program for computing values in the Fibonacci sequence:

```
def fib(n):
    """The Nth Fibonacci number, N>=0."""
    assert n \ge 0
    if n <= 1:
        return n
    else:
        return fib(n-2) + fib(n-1)
```

Here, each invocation of fib makes two calls: work is exponential in depth of calls: A tree-recursive process.

#### A Tree Recursion: Partitions

- partitions(n, k): The number of non-decreasing sequences of two or more positive integers between 1 and k that add up to n.
- For example, partitions(6, 4) is 9:

# Computing Partitions

- ullet Observation: can choose sizes 1-k for the last partition.
- ullet If we choose size k for the last partition, then how many ways are there to partition the rest?

ullet Suppose we choose not to use size k for the last partition, then how many choices are there?

•

• Finally, there is only one way to partition 0 items or to partition a negative number of items or a positive number of items with maximum partition size of 0.

# Computing Partitions

- $\bullet$  Observation: can choose sizes 1-k for the last partition.
- ullet If we choose size k for the last partition, then how many ways are there to partition the rest?
- ullet The number of ways of partitioning n-k items of maximum size k.
- ullet Suppose we choose not to use size k for the last partition, then how many choices are there?

 Finally, there is only one way to partition 0 items or to partition a negative number of items or a positive number of items with maximum partition size of 0.

# Computing Partitions

- $\bullet$  Observation: can choose sizes 1-k for the last partition.
- ullet If we choose size k for the last partition, then how many ways are there to partition the rest?
- ullet The number of ways of partitioning n-k items of maximum size k.
- ullet Suppose we choose not to use size k for the last partition, then how many choices are there?
- ullet The number of ways of partitioning n items of maximum size k-1.
- Finally, there is only one way to partition 0 items or to partition a negative number of items or a positive number of items with maximum partition size of 0.

### Partitions, concluded

#### This leads to the following program:

```
def partitions(n, k):
    """The number of ways of partitioning N items into partitions of si
    <=K . " " "
    if n == 0:
        return 1
    elif n < 0 or k \le 0:
        return 0
    else:
        with_k =
        without_k =
        return with_k + without_k
```

### Partitions, concluded

#### This leads to the following program:

```
def partitions(n, k):
    """The number of ways of partitioning N items into partitions of si
    <=K . " " "
    if n == 0:
        return 1
    elif n < 0 or k \le 0:
        return 0
    else:
        with_k = partitions(n-k, k)
        without_k = partitions(n, k-1)
        return with_k + without_k
```
