Recursive Functions

Digit Sums

2+0+1+3 = 6

·If a number a is divisible by 9, then sum_digits(a) is also divisible by 9. ·Useful for typo detection!

 $\hbox{-Credit cards actually use the Luhn algorithm, which we'll implement after digit_sum.}\\$

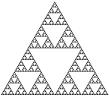

Announcements

- *Homework 2 due Tuesday at 11:59pm
- •Project 1 due Thursday at 11:59pm
- -Extra debugging office hours in Soda 405: Tuesday 6-8, Wednesday 6-7, Thursday 5-7 -Readers hold these office hours; they are the ones who give you composition scores!
- Optional guerrilla section Monday 6pm—8pm, meeting outside of Soda 310
- -Midterm 1 is next Monday 9/23 from 7pm to 9pm in various locations across campus
- *Closed book, paper-based exam.
- "You may bring one hand-written page of notes that you created (front & back).
- "You will have a study guide attached to your exam.
- -Midterm information: http://inst.eecs.berkeley.edu/~cs61a/fa13/exams/midterm1.html
- *Review session: Saturday 9/21 (details TBD)
- *HKN Review session: Sunday 9/22 (details TBD)
- *Review office hours on Monday 9/23 (details TBD)

Recursive Functions

Definition: A function is called *recursive* if the body of that function calls itself, either directly or indirectly.

 $\label{lem:implication:} \textbf{Implication:} \ \, \text{Executing the body of a recursive function may require applying that function again.}$

Drawing Hands, by M. C. Escher (lithograph, 1948)

Sum Digits Without a While Statement

```
def split(n):
    """Split positive n into all but its last digit and its last digit."""
    return n // 10, n % 10

def sum_digits(n):
    """Return the sum of the digits of positive integer n."""
    if n < 10:
        return n
    else:
        all_but_last, last = split(n)
        return sum_digits(all_but_last) + last</pre>
```

The Anatomy of a Recursive Function

```
The def statement header is similar to other functions

Conditional statements check for base cases

Base cases are evaluated without recursive calls

Recursive cases are evaluated with recursive calls

def sum_digits(n):

"""Return the sum of the digits of positive integer n."""

if n < 10:

return n

else:

all_but_last, last = split(n)

return sum_digits(all_but_last) + last
```

(Demo)

Recursion in Environment Diagrams

```
(Demo)
        def fact(n):
            if n == 0:
return 1
                                                           Global frame
                                                                                    → func fact(n)
                                                                   fact
              else:
                   return n * <u>fact</u>(n-1)
                                                           fact
    7 <u>fact</u>(3)
                                                                     n 3
• The same function fact is called multiple times.
                                                           fact
Different frames keep track of the different arguments in each call.
                                                                     n 2
·What n evaluates to depends upon
                                                           fact
 which is the current environment.
                                                                     n 1
-Each call to {\it fact} solves a simpler problem than the last: smaller {\it n.}
```

Verifying Recursive Functions

Recursion in Environment Diagrams

Iteration vs Recursion

```
Iteration is a special case of recursion
```

```
4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24
Using iterative control:
\det f \text{ fact\_iter}(n): \\ \text{ total, } k = 1, 1 \\ \text{ while } k <= n: \\ \text{ total, } k = \text{ total*} k, k+1 \\ \text{ return total} \end{cases} \qquad \det f \text{ fact}(n): \\ \text{ if } n == 0: \\ \text{ return } 1 \\ \text{ else: } \\ \text{ return } n * \text{ fact}(n-1) \end{cases}
math: \qquad n! = \prod_{k=1}^{n} k \qquad \qquad n! = \begin{cases} 1 & \text{ if } n = 0 \\ n \cdot (n-1)! & \text{ otherwise} \end{cases}
Names: n, total, k, fact_iter \qquad n, fact
```

Example: Example: http://goo.gl/XOP9ps

The Recursive Leap of Faith

```
def fact(n):
    if n == 0:
        return 1
    else:
        return n * fact(n-1)
```

- Is fact implemented correctly?
- 1. Verify the base case.
- 2. Treat fact as a functional abstraction!
- 3. Assume that fact(n-1) is correct.
- 4. Verify that fact(n) is correct, assuming that fact(n-1) correct.

Mutual Recursion

Recursion and Iteration

Converting Iteration to Recursion

The Luhn Algorithm

Used to verify credit card numbers

From Wikipedia: http://en.wikipedia.org/wiki/Luhn_algorithm

- 1. From the rightmost digit, which is the check digit, moving left, double the value of every second digit; if product of this doubling operation is greater than 9 (e.g., 7*2=14), then sum the digits of the products (e.g., 10:1+0=1, 14:1+4=5).
- 2. Take the sum of all the digits.

1	3	8	7	4	3	
2	3	1+6=7	7	8	3	= 30

The Luhn sum of a valid credit card number is a multiple of 10.

(Demo)

Converting Recursion to Iteration

Can be tricky: Iteration is a special case of recursion.

Idea: Figure out what state must be maintained by the iterative function.

(Demo)
